Important todos for optimization

Technical problems

60 pages have a medium response time between 0.5 and 1 second **Very important!**

Only **46** pages that can be indexed by search engines were found. Inspect "Pages checked" and "Uncheckable pages". **Very important!**

19 pages have problems with H1 headings **Important!**

Problems with headings were found on **16** pages **Important!**

On **46** pages the alt attributes are missing for integrated images **Tip!**

17 pages have problematic meta descriptions **Tip!**

21 pages have problems using strong or bold tags properly **Tip!**

Sitestructure problems

400 external links have problems **Important!**

Content problems

We found pages with robots meta tag "nofollow" **Important!**

38 content/text blocks were found that are present on more than one page **Important!**

On **18** pages only some paragraphs were found **Tip!**

Pages with technical problems

Pages that could not be checked due to technical problems

No errors or problems were found.

Pages with problematic page titles

Problematic pages or page titles that require optimization

Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with the page titles on your website.

Why page titles are important for SEO:

The title of a web page (also known as the **"meta title"** or **"title tag"**) is one of the most important elements for on-page search engine optimisation. Search engines such as Google analyse the title to understand the content of a page and use the information it contains for ranking purposes. In addition, the title is displayed as the most prominent element in search results and should encourage searchers to click on the "search snippet". If the title tag is missing on a page, or if the title does not meet Google's requirements, Google may generate its own title for the search results, which may lead to less ideal results.

What the notes in the "Problems" column mean:

- **Empty:** The title tag for this page contains no content.
- **Missing:** No title tag was found for this page.
- **Too short:** The page title is very short, wasting valuable optimization potential.
- **Only one word:** The page title consists of only 1 word, wasting valuable optimization potential.
- **Too long:** The page title is very long and is likely to be truncated in the search results.
- **Meaningless word:** The title gives no information about the content of the page.
- **Domain within the title:** The title contains only the domain name and gives no information about the content of the page.
- **Word repetition:** The title contains repeated words and could be interpreted as [keyword stuffing](#).

How to optimize your page titles:

- Length of 55 to 65 characters.
- Important keywords for the page should be used in the title.
- 2 to 3 keywords should be used in a logical context.
- The most important keywords should be located at the beginning of the title.
- The title of a page should not change too frequently.
- Each title should only appear once on the whole website.

You can find more optimization tips and information [in our wiki](#).

Tip: Use [Seobility's SERP snippet generator](#) to easily optimize the length of your page titles.

Problems with meta descriptions

Missing or bad meta descriptions.

Optimization Tips

Video tutorial included ►

This analysis shows you pages with [meta description](#) problems.

Why meta descriptions are important for SEO:

Although a page's meta description doesn't directly affect the ranking of the page, it's an important element for SEO because it's displayed in the search results snippet in the [SERPs](#). It should encourage searchers to click on your snippet as it is the first contact they have with your website. For this reason, you should write an engaging meta description for each relevant page of your site.

If there's no meta description, or if Google thinks your description is not relevant enough, Google will usually display a text snippet from the page that contains the terms that a user was searching for.

What the notes in the "Problems" column mean:

- **Missing:** No meta description was found on the page.
- **Empty:** The meta description tag for this page contains no content.
- **Too short:** The page's meta description is very short and leaves room for optimization.
- **Only one word:** The meta description consists of only one word and leaves room for optimization.
- **Multiple:** Multiple meta descriptions were found on the page.
- **Too long:** The meta description is very long and is likely to be truncated in the search results.

How to optimize your meta descriptions:

- Keep to a maximum length of around 1000 pixels (**Tip:** You can easily optimize the length of your meta descriptions with the [SERP Snippet Generator from Seobility](#)).
- Provide a description of the page content that is as precise and understandable as possible and that encourages users to take action ("buy", "inform", "compare", "download", etc.).
- Avoid very general descriptions that reveal little about the content of the page.
- Use keywords that are relevant to the page. These will appear in bold in the snippet for relevant searches, highlighting the relevance of your results.
- Avoid [keyword stuffing](#).
- Create a unique meta description for each relevant page.

You can find a full guide to optimizing your meta descriptions [on our blog](#).

How to set a meta description in the most popular content management systems:

Problems with H1 headings

Problematic H1 headings

Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with the H1 headings on your website.

Why H1 headings are important for SEO:

Headings are used to structure the body text on a website, making it easier for visitors to navigate. In addition, headings provide an overview of the page content and are also used by search engines

when analyzing the page content.

Generally, there is a hierarchical structure of headings from H1 to H6. The H1 heading is the most important heading and should summarize the entire content of a page. It should be as specific and informative as possible, and include the most important keywords.

What the notes in the "Problems" column mean:

- **Missing:** No H1 heading was found on the page.
- **Empty:** The H1 tag contains no content.
- **Too short:** The content of the H1 tag is very short (e.g. two very short words) and may not be informative enough.
- **Only one word:** The H1 tag contains only one word and may not be informative enough.
- **Too long:** The content of the H1 tag is very long (more than 120 characters). Keep your headings as short and clear as possible.
- **Unimportant words:** The content of the H1 tag is very general (e.g. "Welcome") and does not provide information about the specific content of the page.
- **Too many:** The page contains more than one H1 heading, indicating that the structure needs improvement. Ideally, only one H1 should be used.

How to use H1 headings correctly:

- Only one H1 heading should be used on each page. Although Google is capable of handling multiple H1 headings, we recommend that you implement a clear hierarchical heading structure with a single main heading. This will keep the page clear for your visitors too.
- The heading in the H1 tag should match the page content and contain relevant keywords.
- The H1 heading should summarise the content of the page concisely and should not be too long.
- In general, headings should only be used to structure content and not for navigation elements, links, etc.

For more tips and information on optimizing your H1 headings, [see our wiki](#).

Problems with headings

Pages with problematic headings or problems within the heading structure

Optimization Tips

Video tutorial included ►

This analysis provides an overview of pages where Seobility detected problems with headings.

Why headings are important for SEO:

Headings are used to structure the body text on a website, making it easier for visitors to navigate. In addition, headings provide an overview of the page content and are also used by search engines

when analyzing the page content.

Generally, there is a hierarchical structure of headings from [H1 to H6](#), which can be compared to the hierarchy of headings in a regular text document. You should follow this hierarchy as far as possible to make your pages clearer for both search engines and visitors.

What the notes in the "Problems" column mean:

- **Empty heading:** The page contains empty heading tags.
- **Structural problem:** There is an error in the heading hierarchy, such as gaps in the hierarchy (e.g. H1 > H2 > H4) or errors in the order (e.g. H1 > H3 > H2).
- **Duplicate heading:** The page contains multiple headings with the same content.
- **Missing:** No headings were found on the page. You should add headings to structure the content.
- **Too many headings:** The page contains many heading tags. Check that their number is appropriate to the amount of text.

Click "Details" for more information about which specific headings on a page are affected by a problem.

How to use headings correctly:

- Headings should always be informative and reflect the content of the following section of text. Ideally, they should also contain important keywords.
- The number of headings should be reasonable in relation to the amount of text.
- To structure a paragraph more granularly, always use the next lower hierarchy level without jumps (after H1 comes H2, etc.).
- Headings should be neither too short nor too long.
- Use headings only to structure content and not for navigation elements, links or surrounding layout (e.g. contact forms, widgets, etc.). When in doubt, ask yourself if the heading you are using is related to the content of the page. If not, do not format it as a heading.

You can find more tips and information on how to optimize your headings [in our wiki](#).

Problems with strong and bold tags

Check of strong and bold tags finding too short, too long and duplicate tags.

Optimization Tips

Video tutorial included ►

This analysis provides an overview of pages where problems with strong and bold tags were detected.

What are strong and bold tags and what are they used for?

The tags `<strong>` and `<b>` are used to highlight important words or statements in a text. Both tags cause the text they contain to be displayed in bold. Unlike the bold tag, the strong tag also marks up the text as "semantically important".

The tags are a good way of making users aware of important elements and text sections on a page. From an SEO perspective, however, they do not offer much room for optimization. You just want to avoid using them too much, as this could give the impression to search engines that the page is over-optimized and unnatural.

What the notes in the "Problems" column mean:

- **Many tags:** A large number of strong or bold tags have been found on the page. Check that their number is appropriate to the amount of text.
- **Empty tags:** Empty strong or bold tags were found on the page. You should remove these from the HTML code.
- **Too long:** The text marked up with bold or strong tags is longer than 70 characters. Check if you can reduce the length.
- **Duplicate:** The same words are marked up with bold or strong several times.

The video tutorial above will show you how to find the problematic tags on your site.

How to use strong and bold tags correctly:

- Use the strong tag instead of bold to emphasize important text. Unlike bold, the strong tag is not just a layout element.
- Ideally, you should only use these tags to emphasise small chunks of text of up to 70 characters (rather than long strings of text).
- The number of visual highlights should be appropriate to the total amount of text.

You can find more tips on the correct use of strong and bold tags [in our wiki](#).

Images with missing alt attributes

Pages with at least one missing alt attribute for an image

Optimization Tips

Video tutorial included ►

This list contains pages that have images with missing [ALT attributes](#).

Why ALT attributes are important for SEO:

Image ALT attributes are alternative image descriptions that browsers should display to visitors when an image fails to load. For search engines, these descriptions provide valuable information about the content of an image. This allows them to get a better understanding of the image content and associate it with a keyword or a subject area.

You can find more information about ALT attributes [in our wiki](#).

How to fix missing ALT attributes:

The pages in this list have been found to have either

- a missing ALT attribute, or
- an empty ALT attribute.

Click on "Details" next to the URL to find out which image files are affected.

Then, add an alternative description for each of these images on your website that accurately describes the image content.

You can find more tips on how to optimize your images for search engines in our [wiki article "Image SEO"](#).

How to add ALT attributes to images in the most popular content management systems:

Used files that have problems

Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with embedded files on your website.

Why you should avoid problems with files on your website:

Files that are needed to **render** a page should be optimized in the same way as the HTML page itself.

Problems with files can result in the page not rendering correctly. This can have a negative impact on the user experience. It can also negatively affect **page speed**, which is an important Google ranking factor.

Overview of what the error messages ("Problem" column) mean and how to fix them:

- **Missing content-type specification:** Your server is not providing **content-type** information when transferring the file, which can lead to rendering problems in the browser. Make sure that there is a content-type specified in the **HTTP header** for each file.
- **Different file extension:** The file extension does not match the content-type that is specified. Make sure that the two specifications are in line in order to avoid any display problems. For example, a CSS file with content-type "text/css" should end with ".css".
- **Missing compression:** Files are not sent compressed from the server, which can make loading slow. Use compression, like **gzip** for text files.
- **High load time:** The file takes longer than 1 second to load. Check out [our blog to find out](#) how to improve your loading speed.
- **Redirect:** The source URL of the linked file redirects to a different URL. Avoid unnecessary redirects by linking all files directly to the target file.
- **Large file size:** The file size is very large. Make sure that your images are no larger than 2 MB and that your CSS and JavaScript files are no larger than 0.5 MB.

#	URL	Statuscode	Content type	Loading time	File Size	Issue

Non HTTPS content on HTTPS pages

Pages that are encrypted for transport via https, but contain insecure content such as images, etc.

No errors or problems were found.

Too many files within a page

Pages with too many included files

No errors or problems were found.

Medium response time

Pages that have a medium response time

Optimization Tips

The URLs in this list had an average server response time (between 0.5 and 1 second) when your website was crawled by Seobility.

Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "page speed") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

Note: This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

Slow response time

Pages that are slower than the average or even exceed the acceptable response time limit. Only the HTML page response time is checked.

Optimization Tips

The URLs in this list had a slow server response time when your website was crawled by Seobility (compared to the average response time of your pages).

Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "page speed") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

Note: This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

What to do in case of long response times:

One of the most frequent solutions for long response times is to check if [caching](#) and preloading are enabled on your server. Caching ensures that the server always has the content of your pages "at hand". This allows the server to respond more quickly to requests.

Please note: If you experience long response times in one crawl, and then see a significant improvement in a second crawl (without having changed anything), this is usually due to the server cache being filled in the first crawl and then being ready for the second crawl. Therefore, make sure that your server cache is already filled **before** you crawl your website with Seobility to avoid such fluctuations in the results of this analysis.

Internal link anchor texts that need improvement

Link anchors that can be improved

Optimization Tips

Video tutorial included ►

Here you will find pages that are internally linked with [link texts](#) that need improvement.

Why link text is important for SEO:

A link's anchor text is a very important element from an SEO perspective, as it tells search engines what the linked page is about. Ideally, it should contain the [keyword](#) for which the linked page (target page) is intended to rank. Link texts offer great potential for optimization, especially for internal links. This is because the frequent use of [exact-match" keyword link texts](#) is usually not penalized (unlike the use of such link texts for [backlinks](#)).

What the notes in the "Problems" column mean:

- **Link text to page is empty:** There are internal links pointing to the page with an empty link text.
- **Link anchor text is trivial:** The link text that is used to link to the page says nothing about the content of the page. (Typical examples are link text such as "here", "read more" or "read the article").
- **Link anchor text too long:** The text linking to the page is over 120 characters and should be shortened.
- **The link contains an image but has no alt-attribute:** The link to the page is not a regular text link, but is an image link. For such image links, search engines use the [ALT attribute](#) instead of the link text to learn about the linked page. However, when this error occurs, the image has no ALT attribute.

By clicking "Details", you can find out which page contains the link text that needs improvement.

How to optimize your link texts:

- The link text should provide a short, but still meaningful, description of the content of the page being linked to.
- Ideally, the link text should contain the keyword for which you want the linked page to be ranked.
- You should always provide a link text for a text link and an ALT attribute for an image link.

You can find more detailed instructions on how to optimize your internal links, including the link text, in our [internal linking guide](#).

#	Linked page	Problems

Identical anchor text for different pages

Link anchors that are used for different pages

No errors or problems were found.

Redirects

Internal redirects that have been linked

Optimization Tips

Video tutorial included ►

This list includes internally linked URLs that redirect to another URL on your website via a server-side [redirect](#) (status code 301).

Why you should avoid having internal links to redirecting URLs:

301 redirects are a good option if you need to change the URL of a page, or if you want to redirect multiple URLs to a single URL. However, for internal links, it is best not to link to a URL that redirects to another URL. Instead you should link directly to the destination of the redirect. This will avoid any errors if you decide to remove the redirect at some point.

Search engines like Google do follow your redirects (even if you have multiple redirects in a row), but if you use a lot of redirects, you are unnecessarily wasting the [crawling resources of the search engine bots](#). This keeps the bots busy following your redirects rather than crawling your actual page content. It can also increase [page load time](#) as each redirect requires a new request to be sent to the website server.

You can find more information about redirects [in our wiki](#) and [on the Google Search Central page](#).

What the information in this list means:

The left column ("Start URL of the redirect") shows the redirecting URL and (below it) the destination URL. The "Pages that link to a redirect" column lists all the pages that have a link pointing to the redirecting URL. If the link is located in a [canonical tag](#), [alternate link](#) or similar, you will see a note saying "Linked via canonical link, alternate link or similar".

How to fix internal redirects:

Change the links on the linking pages to point directly to the redirect's destination URL.

By clicking on the redirecting URL, you can see more details about where these links are located.

#	Start URL of the redirect	Pages that link to a redirect

Problems with external Links

Problems with external links that are broken or redirect to another page

Optimization Tips

Video tutorial included ►

This analysis provides an overview of problematic [external links](#) on your website.

Why you should fix problems with external links:

Linking to external sites is usually a good idea, as it adds value to your content by providing related resources for your visitors. This is also a sign of quality for search engines. After all, there are no scientific studies or articles without references.

However, external links that point to inaccessible or redirecting pages with different content than expected can lead to a poor user experience. Therefore, you should remove them as soon as possible. Unfortunately, it is not possible to prevent problems with external links in advance, as you usually do not have any control over the content of the linked pages. However, as soon as you see any new problems here, you should check the links and update them if necessary.

You can find more best practices for external links [in our wiki](#).

What the notes in the "Problems" column mean:

- **Bad HTTP status code:** The server of the page you are linking to returns an error code when the URL is requested. You can find an overview of the meaning of the various HTTP status codes [here](#).
- **Page is down:** The server of the linked page did not respond at the time the URL was requested. Possible causes: server problems, the Seobility bot is blocked from accessing the page.
- **Redirect:** The linked page redirects to a different URL.
- **Parked domain:** The linked website is no longer online and the domain has been put up for sale.
- **Domain not connected:** The domain you are linking to is not connected to a web server and is therefore not serving any content.

How to fix these problems:

First, do a manual check of the links in this list in your browser. In this way, you can rule out that the problem was temporary or that only the Seobility bot was blocked from accessing the page.

If the link does not lead to the desired content when manually checking, you should remove or replace the link. The list shows on which pages of your site the external link is included.

Note: The results of this analysis are cached in Seobility for a few days in order to minimize access to other websites. Consequently, you may see some errors here that no longer exist.

Pages that can only be reached with more than 3 clicks from the homepage

No errors or problems were found.

Canonical link errors

Canonical links that refer to broken links

No errors or problems were found.

Alternate link errors

Problems with alternate links (links to specify alternative language or country versions of a page)

No errors or problems were found.

Pages with only a few paragraphs

Pages with little text or few paragraphs

Optimization Tips

The pages in this list contain less than three paragraphs of text.

Why you should break up your content into clear paragraphs:

To make text easier to read and understand, it is very helpful to break it up into paragraphs. This makes it easier for visitors to understand your content. It also increases the likelihood that they will spend more time on your pages.

What does Seobility define as a "text block"?

A "text block" is a coherent text section that contains at least 100 characters and is enclosed by HTML structural elements such as <p> or <div>. Headings or lists are not counted as text blocks.

How to solve these problems:

In addition to the number of paragraphs that were found, the "Number of words" column will show you how long the content of the page is in total. If the word count is high, you should structure the text in a better way. Use headings, teasers, paragraphs and subheadings to break up the text.

On the other hand, if there is little text content on the page, there may be room to expand the content.

Note: For pages with image galleries, result lists, and similar content that does not require long/structured text, you can ignore the warnings.

Pages with little text

Pages that contain only very little text

Optimization Tips

The pages in this list contain less than 500 words.

Why pages with little text can be problematic:

A text that is too short is problematic if the subject or the keyword of the page requires detailed and extensive information. If your competitors are offering better and more comprehensive content on the same topic, you're going to struggle to rank with short content.

However, it is not necessarily a problem to have pages with little text. If the pages are e.g. image galleries, landing pages, etc., it is perfectly fine to use very little text.

In addition, there are times when search engine users are in need of a quick and concise answer to a particular search query, and a long and lengthy text page is not the answer. In this case, long and detailed text may deter visitors.

How you should treat these pages:

Before you make any changes to the content of a page, you should first check whether the topic or target keyword of the page requires extensive content or not. You can do this by analyzing the current top 10 search results. With the [free TF*IDF tool provided by Seobility](#), you can easily check the number of words on these pages.

If you find that the content of your page is in fact too short, you can try to expand it. Think about what kind of information your target audience needs in order to fulfil their [search intent](#). However, you'll want to avoid writing long texts that are just designed to boost SEO. Most importantly, your content should add value to your visitors.

You can find more information on how to create high quality and useful content here:

Pages with duplicate paragraphs

Paragraphs that are repeated on a page

Optimization Tips

Video tutorial included ►

This analysis checks for pages where paragraphs of text are used repeatedly.

Why you should avoid duplicate text paragraphs on a page:

High-quality, interesting content that provides real value to visitors is one of the most important factors for a good ranking on Google. It is not a sign of quality content and good page design if the same paragraph is repeated several times on a page. Therefore, it is a good idea to remove duplicate paragraphs from your pages.

How to identify the duplicate paragraphs:

If you click on the red label in the "Number" column, you will get an overview of all the paragraphs that have been found on the page in question. For each paragraph, you can see how many times it is used on the page and how many times on the whole website.

Special case: cookie banners

Cookie banners displayed on all subpages of a website are not problematic from an SEO perspective and are therefore automatically recognized by Seobility and ignored in the analysis. However, to be safe, you can add the ["data-nosnippet" attribute](#) to your cookie banner. This will ensure that Seobility does not analyze this part of the HTML code. Google also recommends using this attribute if you want certain parts of a page's HTML code to be ignored and not displayed in the search result snippet.

Pages using keywords in H1 heading but not in its body text

Pages with keywords in the H1 tag, which don't appear in the page's body text

Optimization Tips

This list includes pages where keywords from the H1 heading do not appear in the text content of the page.

Why H1 headings and content should be consistent:

The [H1 heading](#) is an important on-page SEO element and should be a concise summary of the content of the page. Important [keywords](#) for the page should be included in this heading. To ensure consistency between the H1 heading and the content, these keywords should also be included in the content of the page.

What the information in this list means:

The URLs affected by this problem are shown in the left column. The right column displays each URL's H1 heading. The words in the heading that do not appear in the text content of the page are highlighted in bold.

How to fix these problems:

For each page listed, check that the H1 heading matches the text content of the page, and vice versa.

If the H1 contains the most important keywords, then you should also include these keywords in the text of the page. If, on the other hand, the text is properly optimized and the H1 is not, then you should optimize the H1 and include important keywords for the page there.

Ensure that the H1 heading differs from the [page title](#). Both elements should be unique.

One important note:

This analysis does not consider synonyms or declination of keywords. This means that not all of the pages that are listed here need to be problematic. For example, if you have made grammatical adjustments to a keyword in the text of the page to ensure a natural reading flow, then of course there is no need to make any changes. Search engines such as Google have become very good at recognizing such variations of keywords.

#	URL	H1 heading

Pages with very much text

Pages that contain a lot of text and might be divided into several pages

No errors or problems were found.

Pages using keywords in page title but not in its body text

Pages with keywords in the title tag, which don't appear in the page's body text

No errors or problems were found.

Pages with typos

Page content contains typos

No errors or problems were found.

Pages with filler text and images

Pages with filler texts or images

No errors or problems were found.

Content that appears on several pages

Content/text that is used on more than one page

Optimization Tips

Here you will find an overview of text blocks that are used on several pages of your website.

For this analysis, each text block found on your website is normalized and saved. If the same text block appears on several pages, it is detected and displayed here.

Notes, disclaimers, etc. that appear on a large number of your pages will not be taken into account.

Why you should avoid using duplicate text blocks:

Each page should be unique and tailored to its target [keyword](#). This will ensure that the content is as relevant as possible. That's why you should avoid using duplicate text blocks or generic content.

If very long text blocks are used multiple times on your website, you may also run into problems with [duplicate content](#). For example, if you use long snippets of blog posts on the category pages or the home page of your blog, this could have a negative effect on the rankings of the actual blog posts. This is because Google has to decide which of these pages should appear in the search results if both a category page and a blog post contain relevant content for a keyword. As a consequence, it may choose the wrong one.

How to fix these problems:

As a general rule, you should avoid using generic text that is used on multiple pages. Create unique content for each subpage instead.

To avoid duplicate content problems, keep the preview text of blog articles or similar as short as possible.
