Internal link anchor texts that need improvement

Link anchors that can be improved

Optimization Tips

Video tutorial included ►

Here you will find pages that are internally linked with [link texts](#) that need improvement.

Why link text is important for SEO:

A link's anchor text is a very important element from an SEO perspective, as it tells search engines what the linked page is about. Ideally, it should contain the [keyword](#) for which the linked page (target page) is intended to rank. Link texts offer great potential for optimization, especially for internal links. This is because the frequent use of [exact-match" keyword link texts](#) is usually not penalized (unlike the use of such link texts for [backlinks](#)).

What the notes in the "Problems" column mean:

- **Link text to page is empty:** There are internal links pointing to the page with an empty link text.
- **Link anchor text is trivial:** The link text that is used to link to the page says nothing about the content of the page. (Typical examples are link text such as "here", "read more" or "read the article").
- **Link anchor text too long:** The text linking to the page is over 120 characters and should be shortened.
- **The link contains an image but has no alt-attribute:** The link to the page is not a regular text link, but is an image link. For such image links, search engines use the [ALT attribute](#) instead of the link text to learn about the linked page. However, when this error occurs, the image has no ALT attribute.

By clicking "Details", you can find out which page contains the link text that needs improvement.

How to optimize your link texts:

- The link text should provide a short, but still meaningful, description of the content of the page being linked to.
- Ideally, the link text should contain the keyword for which you want the linked page to be ranked.
- You should always provide a link text for a text link and an ALT attribute for an image link.

You can find more detailed instructions on how to optimize your internal links, including the link text, in our [internal linking guide](#).

Redirects

Internal redirects that have been linked

Optimization Tips

Video tutorial included ►

This list includes internally linked URLs that redirect to another URL on your website via a server-side [redirect](#) (status code 301).

Why you should avoid having internal links to redirecting URLs:

301 redirects are a good option if you need to change the URL of a page, or if you want to redirect multiple URLs to a single URL. However, for internal links, it is best not to link to a URL that redirects to another URL. Instead you should link directly to the destination of the redirect. This will avoid any errors if you decide to remove the redirect at some point.

Search engines like Google do follow your redirects (even if you have multiple redirects in a row), but if you use a lot of redirects, you are unnecessarily wasting the [crawling resources of the search engine bots](#). This keeps the bots busy following your redirects rather than crawling your actual page content. It can also increase [page load time](#) as each redirect requires a new request to be sent to the website server.

You can find more information about redirects [in our wiki](#) and [on the Google Search Central page](#).

What the information in this list means:

The left column ("Start URL of the redirect") shows the redirecting URL and (below it) the destination URL. The "Pages that link to a redirect" column lists all the pages that have a link pointing to the redirecting URL. If the link is located in a [canonical tag](#), [alternate link](#) or similar, you will see a note saying "Linked via canonical link, alternate link or similar".

How to fix internal redirects:

Change the links on the linking pages to point directly to the redirect's destination URL.

By clicking on the redirecting URL, you can see more details about where these links are located.

Problems with external Links

Problems with external links that are broken or redirect to another page

Optimization Tips

Video tutorial included ►

This analysis provides an overview of problematic [external links](#) on your website.

Why you should fix problems with external links:

Linking to external sites is usually a good idea, as it adds value to your content by providing related resources for your visitors. This is also a sign of quality for search engines. After all, there are no

scientific studies or articles without references.

However, external links that point to inaccessible or redirecting pages with different content than expected can lead to a poor user experience. Therefore, you should remove them as soon as possible. Unfortunately, it is not possible to prevent problems with external links in advance, as you usually do not have any control over the content of the linked pages. However, as soon as you see any new problems here, you should check the links and update them if necessary.

You can find more best practices for external links [in our wiki](#).

What the notes in the "Problems" column mean:

- **Bad HTTP status code:** The server of the page you are linking to returns an error code when the URL is requested. You can find an overview of the meaning of the various HTTP status codes [here](#).
- **Page is down:** The server of the linked page did not respond at the time the URL was requested. Possible causes: server problems, the Seobility bot is blocked from accessing the page.
- **Redirect:** The linked page redirects to a different URL.
- **Parked domain:** The linked website is no longer online and the domain has been put up for sale.
- **Domain not connected:** The domain you are linking to is not connected to a web server and is therefore not serving any content.

How to fix these problems:

First, do a manual check of the links in this list in your browser. In this way, you can rule out that the problem was temporary or that only the Seobility bot was blocked from accessing the page.

If the link does not lead to the desired content when manually checking, you should remove or replace the link. The list shows on which pages of your site the external link is included.

Note: The results of this analysis are cached in Seobility for a few days in order to minimize access to other websites. Consequently, you may see some errors here that no longer exist.
