## Crawling statistics

| Check                             | Amount | Change |
|-----------------------------------|--------|--------|
| Pages with search engine rankings | 0      | 0      |
| Pages blocked by robots.txt       | 10     | 0      |
| Uncheckable data types            | 3      | 0      |
| Found external Links              | 1,281  | 0      |
| Nofollow pages                    | 1      | 0      |
| Pages with technical problems     | 0      | 0      |

## Meta tags and page attributes

| Check                              | Amount | Change |
|------------------------------------|--------|--------|
| Pages with problematic page titles | 3      | - 10   |
| Problems with meta descriptions    | 6      | - 5    |
| Duplicate page titles              | 2      | + 2    |
| Duplicate meta descriptions        | 0      | - 5    |

## Page optimization and guidelines

| Check                              | Amount | Change |
|------------------------------------|--------|--------|
| Problems with H1 headings          | 7      | - 14   |
| Problems with headings             | 11     | - 6    |
| Problems with strong and bold tags | 18     | - 4    |
| Pages with frames                  | 0      | 0      |
| Pages that contain error reporting | 0      | 0      |
| Images with missing alt attributes | 45     | 0      |
| Pages with big file size           | 0      | 0      |

## URL details

| Check                   | Amount | Change |
|-------------------------|--------|--------|
| URL parameters          | 0      | 0      |
| Session ID in URL       | 0      | 0      |
| Too many subdirectories | 0      | 0      |
| URL too long            | 0      | 0      |

## File sources (Image, CSS, JS)

| Check                               | Amount | Change |
|-------------------------------------|--------|--------|
| Crawled file sources                | 167    | 0      |
| Non-retrievable file sources        | 0      | 0      |
| File sources excluded by robots.txt | 1      | 0      |
| Non HTTPS content on HTTPS pages    | 0      | 0      |
| Issues with file sources            | 4      | - 1    |
| Too many files within a page        | 0      | 0      |

## Load times that differ from the average load time

| Check                | Amount | Change |
|----------------------|--------|--------|
| Fast response time   | 510    | + 3    |
| Medium response time | 33     | - 1    |
| Slow response time   | 4      | - 2    |

## Pages with technical problems

Pages that could not be checked due to technical problems

No errors or problems were found.

# Pages with problematic page titles

Problematic pages or page titles that require optimization

## Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with the page titles on your website.

### Why page titles are important for SEO:

The title of a web page (also known as the **"meta title"** or **"title tag"**) is one of the most important elements for on-page search engine optimisation. Search engines such as Google analyse the title to understand the content of a page and use the information it contains for ranking purposes. In addition, the title is displayed as the most prominent element in search results and should encourage searchers to click on the "search snippet". If the title tag is missing on a page, or if the title does not meet Google's requirements, Google may generate its own title for the search results, which may lead to less ideal results.

### What the notes in the "Problems" column mean:

- **Empty:** The title tag for this page contains no content.
- **Missing:** No title tag was found for this page.
- **Too short:** The page title is very short, wasting valuable optimization potential.
- **Only one word:** The page title consists of only 1 word, wasting valuable optimization potential.
- **Too long:** The page title is very long and is likely to be truncated in the search results.
- **Meaningless word:** The title gives no information about the content of the page.
- **Domain within the title:** The title contains only the domain name and gives no information about the content of the page.
- **Word repetition:** The title contains repeated words and could be interpreted as **keyword stuffing**.

### How to optimize your page titles:

- Length of 55 to 65 characters.
- Important keywords for the page should be used in the title.
- 2 to 3 keywords should be used in a logical context.
- The most important keywords should be located at the beginning of the title.
- The title of a page should not change too frequently.
- Each title should only appear once on the whole website.

You can find more optimization tips and information [in our wiki](#).

**Tip:** Use [Seobility's SERP snippet generator](#) to easily optimize the length of your page titles.

# Problems with meta descriptions

Missing or bad meta descriptions.

## Optimization Tips

Video tutorial included ►

This analysis shows you pages with [meta description](#) problems.

## Why meta descriptions are important for SEO:

Although a page's meta description doesn't directly affect the ranking of the page, it's an important element for SEO because it's displayed in the search results snippet in the [SERPs](#). It should encourage searchers to click on your snippet as it is the first contact they have with your website. For this reason, you should write an engaging meta description for each relevant page of your site.

If there's no meta description, or if Google thinks your description is not relevant enough, Google will usually display a text snippet from the page that contains the terms that a user was searching for.

## What the notes in the "Problems" column mean:

- **Missing:** No meta description was found on the page.
- **Empty:** The meta description tag for this page contains no content.
- **Too short:** The page's meta description is very short and leaves room for optimization.
- **Only one word:** The meta description consists of only one word and leaves room for optimization.
- **Multiple:** Multiple meta descriptions were found on the page.
- **Too long:** The meta description is very long and is likely to be truncated in the search results.

## How to optimize your meta descriptions:

- Keep to a maximum length of around 1000 pixels (**Tip:** You can easily optimize the length of your meta descriptions with the [SERP Snippet Generator from Seobility](#)).
- Provide a description of the page content that is as precise and understandable as possible and that encourages users to take action ("buy", "inform", "compare", "download", etc.).
- Avoid very general descriptions that reveal little about the content of the page.
- Use keywords that are relevant to the page. These will appear in bold in the snippet for relevant searches, highlighting the relevance of your results.
- Avoid [keyword stuffing](#).
- Create a unique meta description for each relevant page.

You can find a full guide to optimizing your meta descriptions [on our blog](#).

# Duplicate page titles

Page titles that are used on several pages

## Optimization Tips

This is a list of page titles used for more than one page on your website.

### Why each page of your website should have a unique page title:

The title of a web page (also known as the "[meta title](#)" or "title tag") is one of the most important elements for on-page SEO. Search engines such as Google analyze the title to understand the content of a page and use the information it contains for ranking purposes.

Therefore, the title should reflect the page content as accurately as possible and be unique for each page. If you are using the same page title for a number of pages, it is likely that the title is not informative enough, or that it does not match the content of each page. This means that you are giving away valuable optimization potential, as all these pages will inevitably be optimized for the same keywords due to the identical title. With a unique title, they may have the potential to rank for other, more differentiated keywords that better match the content of each page.

### Common reasons for duplicate page titles:

- Duplicate pages ([duplicate content](#))
- A page is accessible from multiple URLs and has no [canonical link](#) to the original page (e.g. pages with [parameters](#) in the URL).
- You are using a standard title for a number of sub-pages.
- You describe several pages with the same title, such as the home page and your company description.

### How to fix these issues:

If the duplicate page title is due to duplicate content, you need to find out how this is caused. In many cases, you will be able to fix the problem by adding a [canonical tag](#) to the duplicate pages. See the duplicate content analyses in the "Content" section for more information.

In all other cases, you will need to define a unique page title for each of the URLs in question. You can find tips on how to optimize your page titles [in our wiki](#).

### How to edit the page title in the most popular content management systems:

## Duplicate meta descriptions

Meta descriptions that are used on several pages

No errors or problems were found.

# Problems with H1 headings

## Problematic H1 headings

### Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with the H1 headings on your website.

### Why H1 headings are important for SEO:

Headings are used to structure the body text on a website, making it easier for visitors to navigate. In addition, headings provide an overview of the page content and are also used by search engines

when analyzing the page content.

Generally, there is a hierarchical structure of headings from H1 to H6. The H1 heading is the most important heading and should summarize the entire content of a page. It should be as specific and informative as possible, and include the most important keywords.

### What the notes in the "Problems" column mean:

- **Missing:** No H1 heading was found on the page.
- **Empty:** The H1 tag contains no content.
- **Too short:** The content of the H1 tag is very short (e.g. two very short words) and may not be informative enough.
- **Only one word:** The H1 tag contains only one word and may not be informative enough.
- **Too long:** The content of the H1 tag is very long (more than 120 characters). Keep your headings as short and clear as possible.
- **Unimportant words:** The content of the H1 tag is very general (e.g. "Welcome") and does not provide information about the specific content of the page.
- **Too many:** The page contains more than one H1 heading, indicating that the structure needs improvement. Ideally, only one H1 should be used.

### How to use H1 headings correctly:

- Only one H1 heading should be used on each page. Although Google is capable of handling multiple H1 headings, we recommend that you implement a clear hierarchical heading structure with a single main heading. This will keep the page clear for your visitors too.
- The heading in the H1 tag should match the page content and contain relevant keywords.
- The H1 heading should summarise the content of the page concisely and should not be too long.
- In general, headings should only be used to structure content and not for navigation elements, links, etc.

For more tips and information on optimizing your H1 headings, [see our wiki](#).

# Problems with headings

Pages with problematic headings or problems within the heading structure

## Optimization Tips

Video tutorial included ►

This analysis provides an overview of pages where Seobility detected problems with headings.

### Why headings are important for SEO:

Headings are used to structure the body text on a website, making it easier for visitors to navigate. In addition, headings provide an overview of the page content and are also used by search engines

when analyzing the page content.

Generally, there is a hierarchical structure of headings from H1 to H6, which can be compared to the hierarchy of headings in a regular text document. You should follow this hierarchy as far as possible to make your pages clearer for both search engines and visitors.

### What the notes in the "Problems" column mean:

- **Empty heading:** The page contains empty heading tags.
- **Structural problem:** There is an error in the heading hierarchy, such as gaps in the hierarchy (e.g. H1 > H2 > H4) or errors in the order (e.g. H1 > H3 > H2).
- **Duplicate heading:** The page contains multiple headings with the same content.
- **Missing:** No headings were found on the page. You should add headings to structure the content.
- **Too many headings:** The page contains many heading tags. Check that their number is appropriate to the amount of text.

Click "Details" for more information about which specific headings on a page are affected by a problem.

### How to use headings correctly:

- Headings should always be informative and reflect the content of the following section of text. Ideally, they should also contain important keywords.
- The number of headings should be reasonable in relation to the amount of text.
- To structure a paragraph more granularly, always use the next lower hierarchy level without jumps (after H1 comes H2, etc.).
- Headings should be neither too short nor too long.
- Use headings only to structure content and not for navigation elements, links or surrounding layout (e.g. contact forms, widgets, etc.). When in doubt, ask yourself if the heading you are using is related to the content of the page. If not, do not format it as a heading.

You can find more tips and information on how to optimize your headings [in our wiki](#).

# Problems with strong and bold tags

Check of strong and bold tags finding too short, too long and duplicate tags.

## Optimization Tips

Video tutorial included ►

This analysis provides an overview of pages where problems with strong and bold tags were detected.

### What are strong and bold tags and what are they used for?

The tags `<strong>` and `<b>` are used to highlight important words or statements in a text. Both tags cause the text they contain to be displayed in bold. Unlike the bold tag, the strong tag also marks up the text as "semantically important".

The tags are a good way of making users aware of important elements and text sections on a page. From an SEO perspective, however, they do not offer much room for optimization. You just want to avoid using them too much, as this could give the impression to search engines that the page is over-optimized and unnatural.

### What the notes in the "Problems" column mean:

- **Many tags:** A large number of strong or bold tags have been found on the page. Check that their number is appropriate to the amount of text.
- **Empty tags:** Empty strong or bold tags were found on the page. You should remove these from the HTML code.
- **Too long:** The text marked up with bold or strong tags is longer than 70 characters. Check if you can reduce the length.
- **Duplicate:** The same words are marked up with bold or strong several times.

The video tutorial above will show you how to find the problematic tags on your site.

### How to use strong and bold tags correctly:

- Use the strong tag instead of bold to emphasize important text. Unlike bold, the strong tag is not just a layout element.
- Ideally, you should only use these tags to emphasise small chunks of text of up to 70 characters (rather than long strings of text).
- The number of visual highlights should be appropriate to the total amount of text.

You can find more tips on the correct use of strong and bold tags [in our wiki](#).

# Images with missing alt attributes

Pages with at least one missing alt attribute for an image

## Optimization Tips

Video tutorial included ►

This list contains pages that have images with missing [ALT attributes](#).

## Why ALT attributes are important for SEO:

Image ALT attributes are alternative image descriptions that browsers should display to visitors when an image fails to load. For search engines, these descriptions provide valuable information about the content of an image. This allows them to get a better understanding of the image content and associate it with a keyword or a subject area.

You can find more information about ALT attributes [in our wiki](#).

## How to fix missing ALT attributes:

The pages in this list have been found to have either

- a missing ALT attribute, or
- an empty ALT attribute.

Click on "Details" next to the URL to find out which image files are affected.

Then, add an alternative description for each of these images on your website that accurately describes the image content.

You can find more tips on how to optimize your images for search engines in our [wiki article "Image SEO"](#).

## How to add ALT attributes to images in the most popular content management systems:

## Pages with frames

Pages with embedded framesets and IFrames

No errors or problems were found.

## Pages that contain error reporting

Software error messages that are shown on the web page that should be avoided

No errors or problems were found.

## Pages with big file size

HTML pages exceeding a file size of 0.5 MB

No errors or problems were found.

## URL parameters

Relevant pages with dynamic parameters in their URL.

No errors or problems were found.

## Session ID in URL

Pages with session IDs in their URL.

No errors or problems were found.

## Too many subdirectories

Pages with too many subdirectories in their URL.

No errors or problems were found.

## URL too long

Pages with too long URLs

No errors or problems were found.

# Issues with file sources

Used files that have problems

## Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with embedded files on your website.

### Why you should avoid problems with files on your website:

Files that are needed to **render** a page should be optimized in the same way as the HTML page itself.

Problems with files can result in the page not rendering correctly. This can have a negative impact on the user experience. It can also negatively affect **page speed**, which is an important Google ranking factor.

### Overview of what the error messages ("Problem" column) mean and how to fix them:

- **Missing content-type specification:** Your server is not providing **content-type** information when transferring the file, which can lead to rendering problems in the browser. Make sure that there is a content-type specified in the **HTTP header** for each file.
- **Different file extension:** The file extension does not match the content-type that is specified. Make sure that the two specifications are in line in order to avoid any display problems. For example, a CSS file with content-type "text/css" should end with ".css".
- **Missing compression:** Files are not sent compressed from the server, which can make loading slow. Use compression, like **gzip** for text files.
- **High load time:** The file takes longer than 1 second to load. Check out [our blog to find out](#) how to improve your loading speed.
- **Redirect:** The source URL of the linked file redirects to a different URL. Avoid unnecessary redirects by linking all files directly to the target file.
- **Large file size:** The file size is very large. Make sure that your images are no larger than 2 MB and that your CSS and JavaScript files are no larger than 0.5 MB.

| #  | URL                                                                                                                                       | Statuscode | Content type | Loading time | File Size  | Issue           |
|----|-------------------------------------------------------------------------------------------------------------------------------------------|------------|--------------|--------------|------------|-----------------|
| 1. | <a href="https://vnwnqteskbykeucanlhk.supabase.co/storage/v1/object...">https://vnwnqteskbykeucanlhk.supabase.co/storage/v1/object...</a> | 200        | image/jpeg   | 0.220 s      | 4,388.2 kB | Large file size |
| 2. | <a href="https://vnwnqteskbykeucanlhk.supabase.co/storage/v1/object...">https://vnwnqteskbykeucanlhk.supabase.co/storage/v1/object...</a> | 200        | image/jpeg   | 0.166 s      | 2,709.4 kB | Large file size |

| 4. | <a href="https://vnwnqteskbykeucanlhk.supabase.co/storage/v1/object...">https://vnwnqteskbykeucanlhk.supabase.co/storage/v1/object...</a> | 200        | image/jpeg   | 0.226 s      | 3,002.3 kB | Large file size |

## Non-retrievable file sources

Used files that were not retrieved in detail due to redirections and problems

No errors or problems were found.

## Non HTTPS content on HTTPS pages

Pages that are encrypted for transport via https, but contain insecure content such as images, etc.

No errors or problems were found.

## Too many files within a page

Pages with too many included files

No errors or problems were found.

## Medium response time

Pages that have a medium response time

### Optimization Tips

The URLs in this list had an average server response time (between 0.5 and 1 second) when your website was crawled by Seobility.

### Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "page speed") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

**Note:** This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

## Slow response time

Pages that are slower than the average or even exceed the acceptable response time limit. Only the HTML page response time is checked.

### Optimization Tips

The URLs in this list had a slow server response time when your website was crawled by Seobility (compared to the average response time of your pages).

### Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "page speed") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

**Note:** This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

### What to do in case of long response times:

One of the most frequent solutions for long response times is to check if [caching](#) and preloading are enabled on your server. Caching ensures that the server always has the content of your pages "at hand". This allows the server to respond more quickly to requests.

**Please note:** If you experience long response times in one crawl, and then see a significant improvement in a second crawl (without having changed anything), this is usually due to the server cache being filled in the first crawl and then being ready for the second crawl. Therefore, make sure that your server cache is already filled **before** you crawl your website with Seobility to avoid such fluctuations in the results of this analysis.
