

On-page SEO Check for motopůjčovna

Report type: Full export
Crawling from: 05/10/26
Report created on: 05/10/26
Crawled pages: 850

Optimization overview

Check type	Result	Change*
Tech. & Meta	0 %	-/-
Structure	0 %	-/-
Content	80 %	-/-

* A change can be computed after the second crawl

Overall score

History graph of optimization

The historical optimization graph is available only at the end of the 2nd crawling

Project Checklist

Check	Result
Charset encoding	utf-8
Average links per page	28
www. redirect	OK
Redirect for https://	OK
Avg. response time	0.22
Only for adults	No
Language	cs-cz
Transfer encoding	Yes
Software version	-/-

Important todos for optimization

Technical problems

All subpages are pointing via canonical link or redirect to the homepage! Only one page could be checked. This may indicate a larger problem.	Very important!
55 page/s could not be checked due to technical problems	Very important!
9 pages have a poor response time	Very important!
27 pages have a medium response time between 0.5 and 1 second	Very important!
Only 1 pages that can be indexed by search engines were found. Inspect "Pages checked" and "Uncheckable pages".	Very important!
On 1 pages the alt attributes are missing for integrated images	Tip!
1 pages have problems using strong or bold tags properly	Tip!

Sitestructure problems

90 redirects were found, which point to themselves per redirect or canonical link (infinite loops)	Very important!
562 Canonical links are erroneous, check it immediately.	Very important!
21 pages redirect to an erroneous target page.	Very important!
313 external links have problems	Important!
259 internal redirects were found	Tip!

Content problems

We found pages with robots meta tag "nofollow"	Important!
--	------------

Pages without proper keyword optimization	0	-/-
Content that appears on several pages	0	-/-
Duplicate Content	0	-/-
Competing pages for the same keywords	0	-/-
Complete page duplicates	0	-/-

Pages with technical problems

Pages that could not be checked due to technical problems

Optimization Tips

Video tutorial included ►

The URLs in this list could not be retrieved by the Seobility crawler due to technical problems.

Why you should avoid technical issues:

Technical problems are not only frustrating for your visitors, but they can also cause search engines to miss potentially important content or to stop crawling your site. Avoid these errors at all costs to ensure that all of your important content can be crawled and [indexed](#) by search engines.

Most common error messages (in the column "Problem"):

- Request failed: The Seobility crawler could not reach the server when requesting this URL. Common causes: server performance issues, Seobility bot is blocked from accessing the page.
- Timeout: Your web server was reached but failed to respond within 10 seconds. Common cause: server performance issues.
- HTTP status: When the page was requested, the server sent an error code in response. For an overview of the meaning and causes of various HTTP status codes, [click here](#).
- Filesize too big: The page could not be retrieved because the HTML file is too large (more than 5MB).
- Invalid HTML: The page could not be crawled because the HTML code contains serious errors.
- Bot error (unknown): The page could not be retrieved due to an unknown error. Common cause: JavaScript crawling issues.

Here's how to fix the most common problems:

A common cause of technical problems is **poor server performance**. This can lead to error messages such as "Request failed" and "Timeout" and often occurs in combination with long response times (see the "Distribution of response times" analysis in the Tech & Meta section). You can find [tips for improving server response times here](#).

Another common cause is that the **Seobility bot is blocked from accessing your site**, which can lead to error messages such as "Request failed" or "HTTP status 403". In these cases, make sure that the Seobility bot is allowed to access your site. A list of user agents and Seobility IP addresses is available [here](#).

In case of 404 errors: correct or remove all internal links pointing to the broken URL. You can find these links by clicking on the URL in the list and then checking the "Links" tab. If the 404 error is caused by URL changes, you should also set up a 301 [redirect](#) from the old to the new URL.

Why does Seobility find these pages?

In general, a page can appear here for three reasons:

- There are internal links on your site pointing to the URL.
- The URL is ranking on Google.
- The URL has [backlinks](#) from external sites.

To find out how Seobility discovered the URL, click on the URL and check the "Links", "Backlinks" and "Rankings" tabs.

Pages with problematic page titles

Problematic pages or page titles that require optimization

Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with the page titles on your website.

Why page titles are important for SEO:

The title of a web page (also known as the **meta title** or "title tag") is one of the most important elements for on-page search engine optimisation. Search engines such as Google analyse the title to understand the content of a page and use the information it contains for ranking purposes. In addition, the title is displayed as the most prominent element in search results and should encourage searchers to click on the "search snippet". If the title tag is missing on a page, or if the title does not meet Google's requirements, Google may generate its own title for the search results, which may lead to less ideal results.

What the notes in the "Problems" column mean:

- **Empty:** The title tag for this page contains no content.
- **Missing:** No title tag was found for this page.
- **Too short:** The page title is very short, wasting valuable optimization potential.
- **Only one word:** The page title consists of only 1 word, wasting valuable optimization potential.
- **Too long:** The page title is very long and is likely to be truncated in the search results.
- **Meaningless word:** The title gives no information about the content of the page.
- **Domain within the title:** The title contains only the domain name and gives no information about the content of the page.
- **Word repetition:** The title contains repeated words and could be interpreted as [keyword stuffing](#).

How to optimize your page titles:

- Length of 55 to 65 characters.
- Important keywords for the page should be used in the title.
- 2 to 3 keywords should be used in a logical context.
- The most important keywords should be located at the beginning of the title.
- The title of a page should not change too frequently.
- Each title should only appear once on the whole website.

You can find more optimization tips and information [in our wiki](#).

Tip: Use [Seobility's SERP snippet generator](#) to easily optimize the length of your page titles.

How to edit page titles in the most popular content management systems:

Problems with meta descriptions

Missing or bad meta descriptions.

Optimization Tips

Video tutorial included ►

This analysis shows you pages with [meta description](#) problems.

Why meta descriptions are important for SEO:

Although a page's meta description doesn't directly affect the ranking of the page, it's an important element for SEO because it's displayed in the search results snippet in the [SERPs](#). It should encourage searchers to click on your snippet as it is the first contact they have with your website. For this reason, you should write an engaging meta description for each relevant page of your site.

If there's no meta description, or if Google thinks your description is not relevant enough, Google will usually display a text snippet from the page that contains the terms that a user was searching for.

What the notes in the "Problems" column mean:

- **Missing:** No meta description was found on the page.
- **Empty:** The meta description tag for this page contains no content.
- **Too short:** The page's meta description is very short and leaves room for optimization.
- **Only one word:** The meta description consists of only one word and leaves room for optimization.
- **Multiple:** Multiple meta descriptions were found on the page.
- **Too long:** The meta description is very long and is likely to be truncated in the search results.

How to optimize your meta descriptions:

- Keep to a maximum length of around 1000 pixels (**Tip:** You can easily optimize the length of your meta descriptions with the [SERP Snippet Generator from Seobility](#)).
- Provide a description of the page content that is as precise and understandable as possible and that encourages users to take action ("buy", "inform", "compare", "download", etc.).
- Avoid very general descriptions that reveal little about the content of the page.
- Use keywords that are relevant to the page. These will appear in bold in the snippet for relevant searches, highlighting the relevance of your results.
- Avoid [keyword stuffing](#).
- Create a unique meta description for each relevant page.

You can find a full guide to optimizing your meta descriptions [on our blog](#).

How to set a meta description in the most popular content management systems:

- [Instructions for WordPress](#)
- [Instructions for Shopify](#)
- [Instructions for Wix](#)
- [Instructions for Squarespace](#)

Duplicate page titles

Page titles that are used on several pages

No errors or problems were found.

Duplicate meta descriptions

Meta descriptions that are used on several pages

No errors or problems were found.

Problems with strong and bold tags

Check of strong and bold tags finding too short, too long and duplicate tags.

Optimization Tips

Video tutorial included ►

This analysis provides an overview of pages where problems with strong and bold tags were detected.

What are strong and bold tags and what are they used for?

The tags `<strong>` and `<b>` are used to highlight important words or statements in a text. Both tags cause the text they contain to be displayed in bold. Unlike the bold tag, the strong tag also marks up the text as "semantically important".

The tags are a good way of making users aware of important elements and text sections on a page. From an SEO perspective, however, they do not offer much room for optimization. You just want to avoid using them too much, as this could give the impression to search engines that the page is over-optimized and unnatural.

What the notes in the "Problems" column mean:

- **Many tags:** A large number of strong or bold tags have been found on the page. Check that their number is appropriate to the amount of text.
- **Empty tags:** Empty strong or bold tags were found on the page. You should remove these from the HTML code.
- **Too long:** The text marked up with bold or strong tags is longer than 70 characters. Check if you can reduce the length.
- **Duplicate:** The same words are marked up with bold or strong several times.

The video tutorial above will show you how to find the problematic tags on your site.

How to use strong and bold tags correctly:

- Use the strong tag instead of bold to emphasize important text. Unlike bold, the strong tag is not just a layout element.
- Ideally, you should only use these tags to emphasise small chunks of text of up to 70 characters (rather than long strings of text).
- The number of visual highlights should be appropriate to the total amount of text.

You can find more tips on the correct use of strong and bold tags [in our wiki](#).

#	URL	Problems
1.	https://www.motogo24.cz/jak-pujcit/prevzeti	Many tags

Images with missing alt attributes

Pages with at least one missing alt attribute for an image

Optimization Tips

Video tutorial included ►

This list contains pages that have images with missing [ALT attributes](#).

Why ALT attributes are important for SEO:

Image ALT attributes are alternative image descriptions that browsers should display to visitors when an image fails to load. For search engines, these descriptions provide valuable information about the content of an image. This allows them to get a better understanding of the image content and associate it with a keyword or a subject area.

You can find more information about ALT attributes [in our wiki](#).

How to fix missing ALT attributes:

The pages in this list have been found to have either

- a missing ALT attribute, or
- an empty ALT attribute.

Click on "Details" next to the URL to find out which image files are affected.

Then, add an alternative description for each of these images on your website that accurately describes the image content.

You can find more tips on how to optimize your images for search engines in our [wiki article "Image SEO"](#).

How to add ALT attributes to images in the most popular content management systems:

- [Instructions for WordPress](#)
- [Instructions for Shopify](#)
- [Instructions for Wix](#)
- [Instructions for Squarespace](#)

Problems with H1 headings

Problematic H1 headings

No errors or problems were found.

Problems with headings

Pages with problematic headings or problems within the heading structure

No errors or problems were found.

Pages with frames

Pages with embedded framesets and IFrames

No errors or problems were found.

Pages that contain error reporting

Software error messages that are shown on the web page that should be avoided

No errors or problems were found.

Pages with big file size

HTML pages exceeding a file size of 0.5 MB

No errors or problems were found.

URL parameters

Relevant pages with dynamic parameters in their URL.

No errors or problems were found.

Session ID in URL

Pages with session IDs in their URL.

No errors or problems were found.

Too many subdirectories

Pages with too many subdirectories in their URL.

No errors or problems were found.

URL too long

Pages with too long URLs

No errors or problems were found.

Non-retrievable file sources

Used files that were not retrieved in detail due to redirections and problems

No errors or problems were found.

Non HTTPS content on HTTPS pages

Pages that are encrypted for transport via https, but contain insecure content such as images, etc.

No errors or problems were found.

Issues with file sources

Used files that have problems

No errors or problems were found.

Too many files within a page

Pages with too many included files

No errors or problems were found.

Medium response time

Pages that have a medium response time

Optimization Tips

The URLs in this list had an average server response time (between 0.5 and 1 second) when your website was crawled by Seobility.

Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "page speed") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

Note: This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

Slow response time

Pages that are slower than the average or even exceed the acceptable response time limit. Only the HTML page response time is checked.

Optimization Tips

The URLs in this list had a slow server response time when your website was crawled by Seobility (compared to the average response time of your pages).

Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "page speed") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

Note: This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

What to do in case of long response times:

One of the most frequent solutions for long response times is to check if [caching](#) and preloading are enabled on your server. Caching ensures that the server always has the content of your pages "at hand". This allows the server to respond more quickly to requests.

Please note: If you experience long response times in one crawl, and then see a significant improvement in a second crawl (without having changed anything), this is usually due to the server cache being filled in the first crawl and then being ready for the second crawl. Therefore, make sure that your server cache is already filled **before** you crawl your website with Seobility to avoid such fluctuations in the results of this analysis.

Internal link anchor texts that need improvement

Link anchors that can be improved

No errors or problems were found.

Identical anchor text for different pages

Link anchors that are used for different pages

No errors or problems were found.

Redirects

Internal redirects that have been linked

Optimization Tips

Video tutorial included ►

This list includes internally linked URLs that redirect to another URL on your website via a server-side [redirect](#) (status code 301).

Why you should avoid having internal links to redirecting URLs:

301 redirects are a good option if you need to change the URL of a page, or if you want to redirect multiple URLs to a single URL. However, for internal links, it is best not to link to a URL that redirects to another URL. Instead you should link directly to the destination of the redirect. This will avoid any errors if you decide to remove the redirect at some point.

Search engines like Google do follow your redirects (even if you have multiple redirects in a row), but if you use a lot of redirects, you are unnecessarily wasting the [crawling resources of the search engine bots](#). This keeps the bots busy following your redirects rather than crawling your actual page content. It can also increase [page load time](#) as each redirect requires a new request to be sent to the website server.

You can find more information about redirects [in our wiki](#) and [on the Google Search Central page](#).

What the information in this list means:

The left column ("Start URL of the redirect") shows the redirecting URL and (below it) the destination URL. The "Pages that link to a redirect" column lists all the pages that have a link pointing to the redirecting URL. If the link is located in a [canonical tag](#), [alternate link](#) or similar, you will see a note saying "Linked via canonical link, alternate link or similar".

How to fix internal redirects:

Change the links on the linking pages to point directly to the redirect's destination URL.

By clicking on the redirecting URL, you can see more details about where these links are located.

#	Start URL of the redirect	Pages that link to a redirect

Problems with redirects

Redirects that refer to a broken page (404, server error etc.).

Optimization Tips

Video tutorial included ►

This is a list of redirects on your website that lead to an **inaccessible** target URL.

Why you should avoid broken redirects:

Server-side **redirects** (with status code 301) are a good option if you need to change the URL of a page, or if you need to redirect a number of URLs to a single URL. However, if the redirect's destination URL is inaccessible, it is a broken redirect. This is not only frustrating for your visitors, who will receive an error message in their browser. It is also a dead end for **search engine crawlers**.

In addition, you should generally avoid linking to redirects, as they cause an unnecessary step for search engine bots when crawling your site.

What the information in this list means:

The left column shows the redirect's start URL (above) and the redirect's destination below. In the "Pages that link to a redirect" column, you can see all the URLs that link to the start URL.

How to fix broken redirects:

The best way to fix a broken redirect is to link directly (i.e. without a redirect) to a page that is working and accessible. To do this, adjust the links on the pages pointing to the broken redirect ("Pages that link to a redirect" column). This will not only correct the error. It will also save search engine crawlers the redirect step when crawling the site.

If you can't avoid linking to the redirect, you should at least ensure that the target URL of the redirect is accessible, either by correcting the redirect itself or by fixing the problems on the target page.

Redirect loops

Redirect loops because of HTTP redirects and canonical links

Optimization Tips

Video tutorial included ►

The URLs listed here are part of a redirect loop.

What redirect loops are and why they are a problem:

Redirect loops occur when a URL redirects to itself or to a previous redirect.

For example: Page A redirects to page B. However, page B redirects back to page A.

This can happen due to wrongly configured [redirects](#) (301/302 redirects). Another reason could be pages that have another URL set as their [canonical URL](#) but the canonical URL redirects back to the other page (either via a server redirect or via a canonical link).

Redirect loops should be avoided at all costs. In theory, they redirect search engine crawlers endlessly, so that they never reach the destination of the redirect. In reality, crawlers will stop following the redirects once they realize that there's a loop. As a result, the content of URLs in this loop won't be crawled and [indexed](#). In addition to that, endless loops due to redirects also cause site visitors to receive an error message in their browser.

How to fix redirect loops:

Click on the URLs in this list to go to the "Page details" and check the redirect destination. You can click on the URL displayed there and check its redirect destination too. Repeat this step until you have a complete overview of the redirect loop. The "Links" tab of the "Page details" can also be helpful for this.

Then break the loop. For example, remove a page's redirect to itself, or fix incorrect canonical links. Also, make sure that you don't have any internal links to redirecting URLs, but link directly to the destination of the redirect.

Problems with external Links

Problems with external links that are broken or redirect to another page

Optimization Tips

Video tutorial included ►

This analysis provides an overview of problematic [external links](#) on your website.

Why you should fix problems with external links:

Linking to external sites is usually a good idea, as it adds value to your content by providing related resources for your visitors. This is also a sign of quality for search engines. After all, there are no

scientific studies or articles without references.

However, external links that point to inaccessible or redirecting pages with different content than expected can lead to a poor user experience. Therefore, you should remove them as soon as possible. Unfortunately, it is not possible to prevent problems with external links in advance, as you usually do not have any control over the content of the linked pages. However, as soon as you see any new problems here, you should check the links and update them if necessary.

You can find more best practices for external links [in our wiki](#).

What the notes in the "Problems" column mean:

- **Bad HTTP status code:** The server of the page you are linking to returns an error code when the URL is requested. You can find an overview of the meaning of the various HTTP status codes [here](#).
- **Page is down:** The server of the linked page did not respond at the time the URL was requested. Possible causes: server problems, the Seobility bot is blocked from accessing the page.
- **Redirect:** The linked page redirects to a different URL.
- **Parked domain:** The linked website is no longer online and the domain has been put up for sale.
- **Domain not connected:** The domain you are linking to is not connected to a web server and is therefore not serving any content.

How to fix these problems:

First, do a manual check of the links in this list in your browser. In this way, you can rule out that the problem was temporary or that only the Seobility bot was blocked from accessing the page.

If the link does not lead to the desired content when manually checking, you should remove or replace the link. The list shows on which pages of your site the external link is included.

Note: The results of this analysis are cached in Seobility for a few days in order to minimize access to other websites. Consequently, you may see some errors here that no longer exist.

Canonical link errors

Canonical links that refer to broken links

Optimization Tips

Video tutorial included ►

This analysis lists pages with [canonical link](#) errors.

Why you should avoid canonical link errors:

Canonical tags signal to search engines like Google that the linked URL is the "original" version of the page and should be [indexed](#). However, if this URL is inaccessible or, for example, a page has multiple canonical tags, you make it difficult for search engines to index your content correctly. You should therefore make sure that canonical links are always clear and that the linked pages do not have any technical problems.

What the notes in the "Problem" column mean:

- **Problematic status code:** The canonical link points to a URL that returns a problematic HTTP status code (e.g. [404 error](#)). You can find an overview of the meaning and the causes of the various HTTP status codes [here](#).
- **Broken target:** The canonical link points to a "broken" or wrong target, such as an image file instead of an HTML page.
- **Canonical link markup is empty:** There is no URL in the canonical tag for this page.
- **More than one canonical link on page:** The page has more than one canonical tag, which sends conflicting signals to search engines.
- **Canonical link target is redirect:** The URL linked to in the canonical tag redirects to another URL.
- **External domain:** The URL in the canonical tag is located on an external domain. External canonical links should only be used in exceptional cases and only if there is a good reason to do this.

How to use canonical links correctly:

- Every page should have a canonical link pointing to either the original content or the page itself.
- There should be only one unique canonical link for each page.
- The URL in the canonical tag should be an accessible page that has no technical errors or redirects.

You can find more information [about canonical links in our wiki](#).

Alternate link errors

Problems with alternate links (links to specify alternative language or country versions of a page)

Optimization Tips

Video tutorial included ►

Here you will see problems with alternate ([hreflang](#)) links on your website.

Why alternate links are important for SEO:

If you're using different languages or regionalized content on your website, you should use alternate links to tell search engines which URL version of a page is intended for which languages and regions.

This helps search engines to display the correct version of a page in their different country searches (e.g. Google.co.uk, Google.es or Google.fr).

It also helps them understand if multiple URLs are different language/country versions of the same page, rather than [duplicate content](#). For example, if a website has different versions of a page for the US and the UK, alternate links can ensure that these two pages are not considered duplicates.

Best practices to consider when using alternate links:

- Every page that uses alternate links should also have a link to itself. For example, a page in English should also have a link to itself with `hreflang="en"`.
- Alternate links must always be set in both directions. For example, if an English page links to the French version, the French version should also link back to the English version.
- Language and country information in alternate links should use the ISO standard (e.g. "en", "en-US" or "es-US").

You can find more information on how to use alternate links correctly [in our wiki](#).

What the notes in the "Error" column mean:

- **No alternate link pointing to the page itself:** The page does not contain an alternate link to the page itself.
- **Language specified more than once:** The page contains multiple alternate links with the same language specification.
- **Link target appears more than once:** The page contains multiple alternate links with the same target URL.
- **Backlink on target not found:** An alternate link on this page points to a URL that does not link back to the page.
- **Different language for link pointing to page itself:** There is a language conflict on the page itself (for example, if the alternate link to the page itself does not match the [lang attribute](#)).

Click "Details" to get more information about the specific problem.

For an overview of possible hreflang tag issues and how to fix them, check out our [blog post](#).

#	URL	Error
1.	https://www.motogo24.cz/jak-pujcit/prevzeti	No alternate link pointing to the page itself

Pages with a lot of internal links

Pages with only a few internal links

Pages with a below-average number of internal links

No errors or problems were found.

Pages with a big distance to the homepage

Pages that can only be reached with more than 3 clicks from the homepage

No errors or problems were found.

Pages using keywords in H1 heading but not in its body text

Pages with keywords in the H1 tag, which don't appear in the page's body text

Optimization Tips

This list includes pages where keywords from the H1 heading do not appear in the text content of the page.

Why H1 headings and content should be consistent:

The [H1 heading](#) is an important on-page SEO element and should be a concise summary of the content of the page. Important [keywords](#) for the page should be included in this heading. To ensure consistency between the H1 heading and the content, these keywords should also be included in the content of the page.

What the information in this list means:

The URLs affected by this problem are shown in the left column. The right column displays each URL's H1 heading. The words in the heading that do not appear in the text content of the page are highlighted in bold.

How to fix these problems:

For each page listed, check that the H1 heading matches the text content of the page, and vice versa.

If the H1 contains the most important keywords, then you should also include these keywords in the text of the page. If, on the other hand, the text is properly optimized and the H1 is not, then you should optimize the H1 and include important keywords for the page there.

Ensure that the H1 heading differs from the [page title](#). Both elements should be unique.

One important note:

This analysis does not consider synonyms or declination of keywords. This means that not all of the pages that are listed here need to be problematic. For example, if you have made grammatical adjustments to a keyword in the text of the page to ensure a natural reading flow, then of course there is no need to make any changes. Search engines such as Google have become very good at recognizing such variations of keywords.
