Important todos for optimization

Technical problems

All subpages are pointing via canonical link or redirect to the homepage! Only one page could be checked. This may indicate a larger problem.

Very important!

11 pages have a poor response time

Very important!

36 pages have a medium response time between 0.5 and 1 second

Very important!

Only **1** pages that can be indexed by search engines were found. Inspect "Pages checked" and "Uncheckable pages".

Very important!

On **1** pages the alt attributes are missing for integrated images

Tip!

1 pages have problems using strong or bold tags properly

Tip!

Medium response time	36	+ 10
Slow response time	11	+ 11

Pages with technical problems

Pages that could not be checked due to technical problems

No errors or problems were found.

Pages with problematic page titles

Problematic pages or page titles that require optimization

No errors or problems were found.

Problems with meta descriptions

Missing or bad meta descriptions.

No errors or problems were found.

Duplicate page titles

Page titles that are used on several pages

No errors or problems were found.

Duplicate meta descriptions

Meta descriptions that are used on several pages

No errors or problems were found.

Problems with headings

Pages with problematic headings or problems within the heading structure

Optimization Tips

Video tutorial included ►

This analysis provides an overview of pages where Seobility detected problems with headings.

Why headings are important for SEO:

Headings are used to structure the body text on a website, making it easier for visitors to navigate. In addition, headings provide an overview of the page content and are also used by search engines

when analyzing the page content.

Generally, there is a hierarchical structure of headings from [H1 to H6](#), which can be compared to the hierarchy of headings in a regular text document. You should follow this hierarchy as far as possible to make your pages clearer for both search engines and visitors.

What the notes in the "Problems" column mean:

- **Empty heading:** The page contains empty heading tags.
- **Structural problem:** There is an error in the heading hierarchy, such as gaps in the hierarchy (e.g. H1 > H2 > H4) or errors in the order (e.g. H1 > H3 > H2).
- **Duplicate heading:** The page contains multiple headings with the same content.
- **Missing:** No headings were found on the page. You should add headings to structure the content.
- **Too many headings:** The page contains many heading tags. Check that their number is appropriate to the amount of text.

Click "Details" for more information about which specific headings on a page are affected by a problem.

How to use headings correctly:

- Headings should always be informative and reflect the content of the following section of text. Ideally, they should also contain important keywords.
- The number of headings should be reasonable in relation to the amount of text.
- To structure a paragraph more granularly, always use the next lower hierarchy level without jumps (after H1 comes H2, etc.).
- Headings should be neither too short nor too long.
- Use headings only to structure content and not for navigation elements, links or surrounding layout (e.g. contact forms, widgets, etc.). When in doubt, ask yourself if the heading you are using is related to the content of the page. If not, do not format it as a heading.

You can find more tips and information on how to optimize your headings [in our wiki](#).

Problems with strong and bold tags

Check of strong and bold tags finding too short, too long and duplicate tags.

Optimization Tips

Video tutorial included ►

This analysis provides an overview of pages where problems with strong and bold tags were detected.

What are strong and bold tags and what are they used for?

The tags `<strong>` and `<b>` are used to highlight important words or statements in a text. Both tags cause the text they contain to be displayed in bold. Unlike the bold tag, the strong tag also marks up the text as "semantically important".

The tags are a good way of making users aware of important elements and text sections on a page. From an SEO perspective, however, they do not offer much room for optimization. You just want to avoid using them too much, as this could give the impression to search engines that the page is over-optimized and unnatural.

What the notes in the "Problems" column mean:

- **Many tags:** A large number of strong or bold tags have been found on the page. Check that their number is appropriate to the amount of text.
- **Empty tags:** Empty strong or bold tags were found on the page. You should remove these from the HTML code.
- **Too long:** The text marked up with bold or strong tags is longer than 70 characters. Check if you can reduce the length.
- **Duplicate:** The same words are marked up with bold or strong several times.

The video tutorial above will show you how to find the problematic tags on your site.

How to use strong and bold tags correctly:

- Use the strong tag instead of bold to emphasize important text. Unlike bold, the strong tag is not just a layout element.
- Ideally, you should only use these tags to emphasise small chunks of text of up to 70 characters (rather than long strings of text).
- The number of visual highlights should be appropriate to the total amount of text.

You can find more tips on the correct use of strong and bold tags [in our wiki](#).

Images with missing alt attributes

Pages with at least one missing alt attribute for an image

Optimization Tips

Video tutorial included ►

This list contains pages that have images with missing [ALT attributes](#).

Why ALT attributes are important for SEO:

Image ALT attributes are alternative image descriptions that browsers should display to visitors when an image fails to load. For search engines, these descriptions provide valuable information about the content of an image. This allows them to get a better understanding of the image content and associate it with a keyword or a subject area.

You can find more information about ALT attributes [in our wiki](#).

How to fix missing ALT attributes:

The pages in this list have been found to have either

- a missing ALT attribute, or
- an empty ALT attribute.

Click on "Details" next to the URL to find out which image files are affected.

Then, add an alternative description for each of these images on your website that accurately describes the image content.

You can find more tips on how to optimize your images for search engines in our [wiki article "Image SEO"](#).

Problems with H1 headings

Problematic H1 headings

No errors or problems were found.

Pages with frames

Pages with embedded framesets and IFrames

No errors or problems were found.

Pages that contain error reporting

Software error messages that are shown on the web page that should be avoided

No errors or problems were found.

Pages with big file size

HTML pages exceeding a file size of 0.5 MB

No errors or problems were found.

URL parameters

Relevant pages with dynamic parameters in their URL.

No errors or problems were found.

Session ID in URL

Pages with session IDs in their URL.

No errors or problems were found.

Too many subdirectories

Pages with too many subdirectories in their URL.

No errors or problems were found.

URL too long

Pages with too long URLs

No errors or problems were found.

Non-retrievable file sources

Used files that were not retrieved in detail due to redirections and problems

No errors or problems were found.

Non HTTPS content on HTTPS pages

Pages that are encrypted for transport via https, but contain insecure content such as images, etc.

No errors or problems were found.

Issues with file sources

Used files that have problems

No errors or problems were found.

Too many files within a page

Pages with too many included files

No errors or problems were found.

Medium response time

Pages that have a medium response time

Optimization Tips

The URLs in this list had an average server response time (between 0.5 and 1 second) when your website was crawled by Seobility.

Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "page speed") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

Note: This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

Slow response time

Pages that are slower than the average or even exceed the acceptable response time limit. Only the HTML page response time is checked.

Optimization Tips

The URLs in this list had a slow server response time when your website was crawled by Seobility (compared to the average response time of your pages).

Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "page speed") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

Note: This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

What to do in case of long response times:

One of the most frequent solutions for long response times is to check if [caching](#) and preloading are enabled on your server. Caching ensures that the server always has the content of your pages "at hand". This allows the server to respond more quickly to requests.

Please note: If you experience long response times in one crawl, and then see a significant improvement in a second crawl (without having changed anything), this is usually due to the server cache being filled in the first crawl and then being ready for the second crawl. Therefore, make sure that your server cache is already filled **before** you crawl your website with Seobility to avoid such fluctuations in the results of this analysis.
